RE: Solutions Engineer, Owl.co

Dear Hiring Team,

I am writing to apply for the Solutions Engineer role at Owl.co in Toronto. The role stands out because it sits exactly where I do my best work: translating complex customer and enterprise requirements into production-grade technical systems, then staying close enough to the deployment to debug issues, keep stakeholders aligned, and make the platform better. Owl.co's focus on applied AI for high-stakes insurance decisions is especially compelling because it requires the same mix of reliability, auditability, security, and clear technical communication that I work with every day in regulated banking environments.

At RBC, I led the 0-to-1 delivery of a patent-pending architecture blueprint platform built with Node.js, TypeScript, and React. The platform uses rules-based recommendations, secure service matching, real-time rendering, and auto-certification workflows to help teams design compliant enterprise solutions in air-gapped, security-constrained environments. I own technical trade-offs across cloud, integration, security, and operational constraints, and I regularly translate ambiguous needs from architecture, infrastructure, security, risk, and product stakeholders into demos, milestones, technical specifications, runbooks, and production-ready delivery.

I also bring hands-on experience with the applied AI and observability concerns behind Owl.co's customer deployments. I am building ASB Assist, an LLM + RAG interface that turns natural-language requirements into compliant architecture diagrams and service recommendations with audit trails, guardrails, and Responsible AI controls. Separately, I architected RBC's institution-wide telemetry platform using OpenTelemetry, Vector, Fluent Bit, Kafka, and Logstash, ingesting 150 TB/day across 10,000+ systems. That work strengthened my ability to trace logs, reason through distributed systems, debug production issues, and design observability patterns that help teams maintain SLAs.

Earlier, as the first engineer at HealthCard, I built a healthcare and insurance-adjacent SaaS product from scratch: React/TypeScript frontend, Node.js/Express APIs, AWS EKS deployment, Hyperledger Fabric verification, and HIPAA-aligned audit logging. That startup environment required the same practical ownership Owl.co describes: balancing product urgency with secure data handling, working directly through unclear requirements, and keeping implementation details understandable to both technical and non-technical stakeholders.

I am based in Toronto and would be comfortable with the five-day onsite model. I value deep technical collaboration, whiteboarding, and fast feedback cycles, and I would welcome the chance to bring my background in enterprise integrations, cloud deployment, production debugging, security reviews, and applied AI systems to Owl.co's customer engagements.

Best regards,

Dhruv Doshi
